### Atomic Structure Electron Configuration Answer

with three unpaired electrons. The electron configuration of nitrogen is thus  $1s^2 2s^2 2p^3$ . At oxygen, with  $Z = 8$  and eight electrons, we have no choice. One electron must be paired with another in one of the 2 p orbitals, which gives us two unpaired electrons and a  $1s^2 2s^2 2p^4$  electron configuration.

### 1.4: Atomic Structure - Electron Configurations ...

Electron Configuration The electrons in an atom fill up its atomic orbitals according to the Aufbau Principle; "Aufbau," in German, means "building up." The Aufbau Principle, which incorporates the Pauli Exclusion Principle and Hund's Rule prescribes a few simple rules to determine the order in which electrons fill atomic orbitals:

### 13 Electron Configuration-T

Electron configurations describe where electrons are located around the nucleus of an atom. For example, the electron configuration of lithium,  $1s^2 2s^1$ , tells us that lithium has two electrons in the 1s subshell and one electron in the 2s subshell. Electron Configuration with Examples Electrons are not placed at fixed positions in atoms, but we can predict approximate positions of them. These positions are called energy levels or shells of atoms. Lowest energy level is 1 and it is denoted with integer  $n=1, 2, 3, 4, 5, 6...$  or letters starting from K, L, N to Q.
