MecaLug Professional offers the same features of the standard version of the lifting lug software of analyzing a single lug or trunnion, but MecaLug Pro also has the added benefit of being able to apply those lugs to a lifting system and analyze what loads would be seen by the crane, cable, and lugs. This Pro feature of the MecaLug allows the designer to consider lifting a piece of equipment or structure, and have the software determine the loads acting on each individual lug.

MecaLug - design and analysis of lifting lugs

MecaLug is a Lifting Lug Software package that is used to design lifting lugs as well as analyze loads acting on lifting lugs for a structure or piece of equipment. Several different styles of lifting lug are offered giving the user multiple options in selecting an appropriate lifting lug. There are also several different configurations in the Lifting Lug Software for different equipment and structures.

Lug Analysis (Air Force Method) The Lug Analysis calculator allows for analysis of lifting lugs under axial, transverse, or oblique loading. This calculator follows the Air Force Method as documented in the Stress Analysis Manual of the Air Force Flight Dynamics Laboratory (FDL). See the instructions within the documentation for more details on performing this analysis.

Lug Analysis. Calculator. Instructions Reference Validation Lug Analysis Calculator. A lug, also known as a lifting lug or a padeye, is essentially a plate with a hole in it where the hole is sized to fit a clevis pin. Lugs are used in combination with clevis pins to transmit load between different mechanical components.

9.3.1 Lug Bearing Strength Under Uniform Axial Load. The bearing stresses and loads for lug failure involving bearing, shear-tearout, or hoop tension in the region forward of the net-section in Figure 9-1 are determined from the equations below, with an allowable load coefficient (K) determined from Figures 9-2 and 9-3. For values of e/D less than 1.5, lug failures are likely to involve shear ...

Lifting Lugs Lifting Lugs require similar checks as trunnions. The main difference is that they must be designed and installed considering specific loading angles. The lug could see a transverse force at the start of the lift, an oblique force as the load is upended followed by an axial force when the load is vertical.
