A polyolefin is a type of polymer produced from a simple olefin (also called an alkene with the general formula C n H 2n) as a monomer. For example, polyethylene is the polyolefin produced by polymerizing the olefin ethylene. Polypropylene is another common polyolefin which is made from the olefin propylene.

Polyolefin-based composites are developed to address the demand for higher load-bearing materials that are required for engineering applications which cannot be satisfied by polyolefins alone. In addition to the base polyolefin matrix, polyolefin composites contain at least one nonpolymeric additive which acts as a reinforcement.

Mariam Al Maadeed - Wikipedia

Polyolefin is a polymer material made from the polymerization of small alkene compounds. Alkenes are organic compounds containing one or more double bonds between carbon atoms. The molecular formula of an alkene is given as C n H 2n whereas n is a small, whole number. When these alkenes form polymers, they are known as monomers.

1.2 These test methods are useful to ensure compatibility and to verify that new formulations of filling or flooding compounds will have no deleterious effect upon the other polyolefin materials being used or, conversely, use these methods to ensure that other polyolefin wire and cable materials are evaluated for possible use not degraded by contact with fillers or floodants already in use.
